

Pitch Engine v2.1: Official Operator's Manual

1. The BYOK (Bring Your Own Key) Infrastructure

SortingSource is a standalone, local-first lead generation and outreach architecture. Unlike traditional SaaS, you own the engine.

- **Accountability:** By downloading and entering your API keys, you accept full responsibility for your outreach actions. You are solely accountable for compliance with anti-spam laws (CAN-SPAM, TCPA) and the terms of service of your API providers.
 - **System Longevity & Self-Updating:** SortingSource is engineered to be future-proof. You do not need to wait for manual software updates to deploy the latest AI models. By using the **Model Override** section in the sidebar, you can manually input new model strings (e.g., `gemini-3.0-pro` or `gpt-6-turbo`, or `specific Hugging Face paths`) as they are released by providers.
 - **Factory Defaults:** If the Model Override fields are left blank, the engine automatically reverts to factory-tested "Compatible Models" (`gemini-2.5-flash`, `gpt-5.4-mini` and `Qwen 2.5 72B Instruct`) to ensure your operation never goes offline.
-

2. Setup: Obtaining Your API Keys

To fuel the engine, you must link your own provider accounts:

- **Google Places API:** Used for the "Hunter" module. [Create Key Here](#).
- **Gemini AI (Google):** Primary synthesis engine. [Create Key Here](#).
- **OpenAI (ChatGPT):** Secondary synthesis option. [Create Key Here](#).
- **Hugging Face:** Open-source synthesis engine. Obtain your [Inference API Token Here](#).
- **Gmail SMTP:** To send emails, you **must** use a [Google App Password](#).
- **Twilio:** Sign up at [Twilio.com](#) for the SMS Gateway (Account SID, Auth Token, and Twilio Number). On your Console Dashboard, locate your **Account SID** and **Auth Token**.

3. The Search Dashboard (Target Hunter)

- **Power Search:** Scrapes Google Places + Business Websites. Note: Deep verification may delay results by 5–10 seconds; this is necessary to bypass bot detection.
- **Accumulate & Skip Known:** Use these together. **Accumulate** grows your list across multiple searches, while **Skip Known** ensures you never pull (or pay for) a lead you already have in your database.
- **Tech Audit:** Scans for missing SSL certificates, mobile optimization issues, and missing tracking pixels.
- **Remember Keys:** Toggling this encrypts and saves your Google API keys to your local machine so you don't have to re-enter them upon restart.

Best Practice: The "Rule of 60"

While the engine can handle larger batches, we recommend running searches in increments of **60 leads at a time**.

- **Why?** Smaller, frequent batches maintain higher data integrity and prevent API timeouts.
- **The Strategy:** Use **Accumulate** and **Skip Known** together. Run 60 leads for one niche, then change the city or niche and run another 60. The table will grow into a clean, massive outreach list without any duplicates.

4. The Pitch Engine: Crafting the Message

This is where your persona is built. The AI writes your emails and texts based *entirely* on the context you provide here.

Input Fields & Impact

- **Your Name & Role:** Be specific. Instead of "Marketing Guy," use "Growth Consultant for HVAC Companies."
- **Credibility (The Hook):** This is the most important field. Mention specific wins, such as "Helping 5 local firms double their bookings last quarter."
- **Core Offer:** Be direct. "Photographer" or "Google Maps Optimization."
- **AI Tone:** Choose a style that matches your brand. "Punchy & Short" works best for SMS, while "Consultative" is better for high-ticket Email.

PRO-TIP: Better thoughts lead to better emails. If you provide vague inputs, the AI will produce vague emails. Spend 5 minutes deeply defining your offer and credibility; it will result in thousands of high-converting drafts.

5. Security, Network & Dispatch

Jitter Delay: The Anti-Spam Shield

The **Jitter Delay** (adjustable slider) adds a random wait time between each message sent.

- **The Purpose:** This is your shield. It injects randomized pauses (e.g., 30–90 seconds) between messages. Without this, your email domain or Twilio number will be flagged as spam within minutes.
- **Recommendation:** Set this between **30–60 seconds**. This mimics human typing speeds and keeps your sender reputation healthy.

Email & SMS Settings

- **SMTP Server:** For Gmail, use `smtp.gmail.com` and port `587`. You **must** use a "Google App Password," not your regular login password.
- **SMS Mode:** When toggled, the engine swaps to the Twilio gateway. The AI will automatically shorten its output to remain compatible with standard text message limits.

The Local Vault (Sensitive Data Storage):

- Clicking **Save to Vault** (the yellow floppy disk icon) encrypts and stores your **API Keys, SMTP/IMAP credentials, and Sender Email** to your local machine.
- **Note on Storage:** This data is written to your local hardware (`localStorage`). It is persistent across restarts but remains strictly on your device; no sensitive keys are ever sent to a third-party cloud.

IMAP & SMTP Reference (Inbound/Outbound):

To ensure the engine can both send pitches and detect replies, use the following server configurations in the "Security & Provider" tab:

Provider	SMTP Server (Outbound)	IMAP Server (Inbound)	Port
Gmail	smtp.gmail.com	imap.gmail.com	587
Outlook / Office 365	smtp.office365.com	outlook.office365.com	587
Yahoo Mail	smtp.mail.yahoo.com	imap.mail.yahoo.com	587

iCloud	smtp.mail.me.com	imap.mail.me.com	587
AOL	smtp.aol.com	imap.aol.com	587

Google App Passwords: The Secure Gateway for Automation

To ensure your **Pitch Engine** can send emails through your Gmail account, you must use a **Google App Password**. Because the engine is a third-party application, Google's standard security will block it unless you provide this specific 16-digit authorization code.

How it Works

A Google App Password is a unique security code that gives a non-Google app permission to access your account without requiring your master password or a 2-Step Verification prompt.

- **Purpose:** Standard passwords are often blocked by Google when used in automated scripts for security reasons. The App Password acts as a "key" designed specifically for one device or app.
- **Prerequisite:** You **must** have **2-Step Verification** (Two-Factor Authentication) turned on in your Google Account settings before the option to create an App Password will appear.
- **Security:** If you ever stop using the engine or suspect your keys are compromised, you can revoke the specific App Password at any time without having to change your main Google password.

Setup Link

You can generate and manage your codes directly at the official Google Security portal:

[Generate Google App Passwords](#)

Steps to Generate

1. Click the link above and sign in to your Google Account.

2. Enter a name for the app (e.g., "Pitch Engine").
3. Click **Create**.
4. Copy the **16-character code** displayed in the yellow bar.
 - *Note: Google will only show this code once. If you lose it, you must delete it and create a new one.*
5. Paste this code into the **App Password** field in your Pitch Engine "Security & Network" tab.

[How to Create Google App Passwords for SMTP](#)

This video provides a step-by-step visual walkthrough on setting up 2-Step Verification and generating the specific 16-digit code required for SMTP email automation.

6. The Dispatch Logs: Tracking Success

The **Dispatch Logs** page is your audit trail.

- **Outbound Logs:** View a "Payload Intercept" of every message sent, including timestamp and target email.
- **Inbox Replies (IMAP Sync):** Switch to the "**Inbox Replies**" tab and click "**Sync IMAP**" to stream replies from your leads directly into the app. This uses the credentials saved in your Security Vault to perform a secure handshake with your email provider.
- **UI Customization:** Use the **Palette** selector in the header to switch between 15 different color themes (Cyan, Emerald, Amber, Rose, etc.) or the "Default" stealth mode.
- **Optimization:** Review your logs to see which "Core Offers" or "AI Tones" are getting the best response rates. If one campaign is "☒ SENT" and getting replies, save that persona as a template.

7. Maintenance & API Compatibility

This is a standalone, local-first program.

- **Standalone Nature:** There is no "Cloud" component. You own the software and the data.
- **Dynamic Model Compatibility:** API models (like Gemini or GPT) change frequently. Unlike other software, you do not need to wait for a patch for model name changes. Simply use the **Model Override** tool in the sidebar to point the engine to the newest version strings provided by Google or OpenAI.

- **Patches & Support:** If the app is absolutely not working due to a structural API shift or engine failure, contact the developer at: **ronGdesigns313@gmail.com**.
 - **The Process:** If a core structural update is required, you will receive a notification to download the updated .exe. Your local database (**outbound_crm.db**) will remain untouched so you never lose your leads.
 -
-

8. Final Disclaimer

This tool is a high-output engine. Misuse (spamming without intent, ignoring opt-outs, or utilizing stolen keys) is strictly prohibited by the terms of service of your API providers. By using this software, you agree to be accountable for your own actions and to respect the communication boundaries of the businesses you contact.

Systems Online. Happy Hunting.
